

Photocrosslinking Optimization Protocol **GelX Series bioinks**

This is a suggested procedure, please adjust according to your experimental needs.

Protocol aim

The aim of this protocol is to provide instructions for how to optimize the photocrosslinking of bioinks using photoinitiators (PI) such as LAP or Irgacure. This protocol can be used when recommended crosslinking procedure is not sufficient or does not apply, for example at other PI concentrations or dilutions.

Materials needed

- GelX Series bioinks with PI*
- Water/PBS
- BIO X* or INKREDIBLE+* 3D Bioprinter
- UV shielding cartridges, 3cc*
- Conical bioprinting nozzles, 22-27G*
- Well plate or Petri dish
- 365/405 nm light module for photocuring
- Spatula

*The products can be purchased in the CELLINK store at www.cellink.com/store/.

KEEP THE INK PROTECTED FROM LIGHT IF TRANSFERRED FROM THE ORANGE UV PROTECTED CARTRIDGES TO AVOID CROSSLINKING BEFORE PRINTING. WORK WITH 3D PRINTERS IN DARK MODE. THE PHOTOINITIATOR IS SENSITIVE TO REPEATED OR PROLONGED EXPOSURE TO HEAT.

Protocol

This protocol works best using the BIO X with the cooled print bed. When using the INKREDIBLE+ system, after deposition, printing substrates such as Petri dish or well plate should be placed on ice or another cooled surface to stabilize the construct prior to photocrosslinking.

Note: Room temperature is within 20-25°C.

Step	Title	Material	Description
1	Prepare bioink	- GelX Series bioinks	Heat up the bioink in a cartridge to 33-37°C. The heating of the bioink can be performed in a pneumatic printhead, water bath or incubator.
2	Eventual dilution	- Water/PBS	Simulate any cell suspension dilution of the bioink with water or PBS. Mix in according to Mixing Cells Protocol GelX series.
3	Cool and load the cartridge	 UV shielding cartridges, 3cc loaded with GelX Conical bioprinting nozzles, 22- 27G 	 Place cartridge on counter for 20 min to reach room temperature. The cartridge can be placed on ice or in the refrigerator briefly for faster cooling. Place the room tempered GelX in the printhead and cap with the desired printing nozzle. If using the BIO X, pre-cool the print bed to 15°C. Note: When printing with GelX the recommended bioink temperature is 20-25°C. Overheating during printing may destabilize the bioink and negatively influence the printing fidelity.
4	Printing	 Bioprinter (BIO X or INKREDIBLE+) Well plate 	Bioprint several structures in a well plate according to your experimental needs or
5	Crosslinking optimization	- 365/405 nm light module for photocuring	 Ensure that the bioprinted constructs are thermally gelled after printing by cooling the print bed if using the BIO X or placing the well plates containing printed construct on ice for 10 s if using the INKREDIBLE+. If photocrosslinking <i>in situ</i> during bioprinting, set the crosslinking parameters appropriately in the G-code for the INKREDIBLE+ or the printhead setup page for the BIO X. Choose relevant times and distances from light according to the example in Table 1. Crosslink 1-3 constructs per chosen parameter. Let the structure sit for 1-5 min to allow crosslinking after the light source is turned off.

Boston, USA 75 Kneeland Street Boston, MA 02111 Gothenburg, Sweden Arvid Wallgrens Backe 20, Gothenburg, 41346 Blacksburg, USA 2000 Kraft Dr, Suite 2125 Blacksburg, VA 24060 Kyoto, Japan 46-29 Yoshida-Shimo Adachicho, Sakyo-ku, Kyoto

			Note: Bioink with LAP can be crosslinked using the 405 or 365 nm photocuring module. It is recommended to use the 405 nm photocuring module instead of 365 if possible. Irgacure can only be crosslinked with the 365 nm module.
6	Incubation	- Water/PBS	 After photocrosslinking, add warm water or PBS in the wells to cover the constructs and agitate the plate for 2 min. Incubate the constructs at 37°C for a few hours or overnight.
7	Crosslinking check	- Spatula	 Check if the constructs are holding their shape by lifting the construct with a spatula. Fill in the success rate according to Figure 1 of the constructs that hold their shape and those that has dissolved. Choose the successful crosslinking with the lowest time and distance for your experiment since over exposure to the constructs might damage the cells.
